

## STINGRAY – PHISHING ATTACK SIMULATOR IN 5 EASY STEPS

Stingray is an easy-to-use automated phishing tool that helps strengthen an organization's defenses from hackers.

The tool sends simulated phishing emails to employees for real-time testing and tracks the results over time. Continuous simulations give employees experience with phishing attacks and allows them to apply lessons learned from our Security Awareness Training in their everyday environment.

- 1 Create a Campaign**  
Name the campaign, select the start and end dates, and upload the contact information for those you wish to target. Contacts can be saved into groups to speed up the process for future campaigns.
- 2 Design the Attack**  
Stingray has 150+ pre-built email templates and landing pages of popular brands to choose from such as: Amazon, ADP, and Microsoft. If the templates aren't enough, you can create your own templates in the platform!
- 3 Launch the Simulation**  
Once you have decided on the email and the landing page those tricked will be sent to, simply launch the campaign.
- 4 Monitor Results**  
Stingray's dashboard shows who clicked on the links in the email and which users entered password credentials. The people who got "phished" are automatically presented a Security Awareness Training video giving them tips to avoid falling victim again.
- 5 Re-test those who got "phished"**  
After watching the Security Awareness Training video, we recommend re-testing those who got "phished" as well as continuous campaigns to measure and track the Security Awareness of your organization.
